## Installation of soapstone stove Morsø 8150

Soapstone is a soft natural material that must be treated with care when installing the stove. We recommend that two people undertake the installation to prevent accidental scratches and damage to the stove.

The floor on which the stove is assembled must be level to ensure that the assembly of the stove and the loose soapstone sides can be carried out properly.

**Step 1:** Place the stove in position on the floor. Please ensure that the stove is true to spirit level prior to continuing the installation.

**Step 2:** Dismount the smoke baffles and side brick panels; for further details, please refer to the description in the installation and user guide.

**Step 3:** The soapstone side is mounted at the top with one screw and the large washer from the inside of the stove through the cast iron sidewall and into the soapstone side, which has a threaded bushing to receive the screw. Attach the screw to the soapstone side and tighten it carefully to avoid forcing the bushing loose.

**Step 4:** For mounting the bottom screws into the soapstone side, pull out the drawer or, if preferred, dismantle the drawer completely.

**Step 5:** From within the drawer aperture, the soapstone side is mounted with two screws and washers through the bases and into the soapstone side, which has a threaded bushing to receive the screw. Attach the screw to the soapstone side and tighten it carefully to avoid forcing the bushing loose.

**Step 6:** Repeat steps 3 and 5 for the other side.

**Step 7:** Place the 4 small dowels for the soapstone top plate at the top of the soapstone sides. Then position the top plate carefully on the dowels so it will rest on the soapstone sides.

**Step 8:** Re-mount the smoke baffles and side brick panels on the stove in the opposite order. Check that the smoke baffles and side brick panels are mounted correctly before lighting your stove.

**Please read the remaining instructions before you install and light your new stove.**
